4 STEPS TO MORE SECURE ACCOUNTS

1

Make your passwords long…*not complicated*

Use a phrase or a few random words strung together in a way you can easily remember them.

Make it **15+ characters in length**.

Example*: I-70trafficistheworst!

*please make up your own, though

2

For the love of everything good on this Earth: *Don't use the same password for multiple accounts*

It's easy, sure, but if one account is compromised, then you can assume every other account with that same password is as well.

3

Consider using a password manager

We get it - you have a million passwords to remember.

Use a password manager, like LastPass, to securely store your passwords.

But **make sure you use 2FA**!

4

What is 2FA you ask?

Enabling 2-Factor Authorization, or 2FA, is one of the best things you can do to protect your account.

In addition to your account password, you enter in a secondary form of identification.

This can be a code sent via text, an authentication app-generated code, yubikey, etc.
